

Groundwater Seminar

City of Boulder
June 1, 2017

Presented by: Andrew Earles, Ph.D., P.E., D.WRE

What is groundwater?

What is groundwater?

- ▶ Groundwater is:

- ▶ The water that exists beneath the ground surface filling pore spaces in soils and sediments or cracks and crevices in rocks
- ▶ That portion of rain and snow that percolates into the ground
- ▶ That part of the subsurface water that is in the saturated zone

Where is groundwater?

- ▶ Groundwater can be found in:
 - ▶ pore spaces in soils and sediments or cracks and crevices in rocks beneath the ground surface
 - ▶ If water filled - the Saturated Zone (phreatic zone)
 - ▶ If air and water -the Unsaturated Zone (vadose zone)
 - ▶ The top of the saturation zone is the Water Table
 - ▶ Where the saturated zone produces groundwater at a useable rate - it is called an Aquifer

Where is groundwater?

Where is groundwater?

▶ AQUIFER TYPES

▶ Alluvial Aquifer

- ▶ Unconfined – water table conditions

▶ Bedrock Aquifer

- ▶ Unconfined – water table conditions

- ▶ Confined – pressurized conditions

- ▶ Artesian – potentiometric surface above aquifer
- ▶ Flowing Artesian – potentiometric surface above land

Where is groundwater?

Why is groundwater so enigmatic?

- ▶ Groundwater...
 - ▶ Is difficult to readily observe over a large area from the surface
 - ▶ Moves between pore spaces and in cracks and crevices (therefore not very exciting)
 - ▶ Does not exist as underground streams or lakes (except under very specific geologic conditions)
 - ▶ Can be variable due to seasonal and hydrologic influences

Why is groundwater so enigmatic?

Does groundwater flow and, if so, how?

- ▶ Yes, groundwater flows...
 - ▶ Relatively slowly through bedrock and somewhat faster through soils and sediments (there are exceptions)
 - ▶ In response to differences in water pressure and elevation (i.e., water flows downhill)
 - ▶ Roughly in a direction and rate represented by the general slope of the overlying surface topography

Does groundwater flow and, if so, how?

- ▶ Factors affecting groundwater flow:
 - ▶ Gradient (i) – the slope of the water table ($i = \Delta h / \Delta l$); the steeper the gradient, the faster the movement

Does groundwater flow and, if so, how?

- ▶ Factors affecting groundwater flow:
 - ▶ Porosity (Φ) - the space between solid particles of soil or rock that can be filled with fluid

Main types of porosity

Sand and gravel

Intergranular

Igneous rocks

Crevice

Limestone

Solution

Where groundwater can be found. It fills the spaces between sand grains, in rock crevices, and in limestone openings.

Does groundwater flow and, if so, how?

- ▶ Factors affecting groundwater flow:
 - ▶ Sorting - the degree of similarity of sedimentary particles in a sediment

Does groundwater flow and, if so, how?

- ▶ Factors affecting groundwater flow:
 - ▶ Permeability or hydraulic conductivity (k) - a measure of the ease with which fluids can pass through a body of soil or rock

Permeability and Hydraulic Conductivity

High ←————→ Low

Does groundwater flow and, if so, how?

► Factors affecting groundwater flow:

- Permeability ranges are known for various rock types

Does groundwater flow and, if so, how?

▶ Fundamental Flow Equation

- ▶ Darcy's Law – named after Henry Darcy (1856). His equation describes fundamental groundwater flow.

$$Q = kiA$$

Q = Flow

k = Hydraulic conductivity

i = gradient

A = cross-sectional area perpendicular to flow

Does groundwater flow and, if so, how?

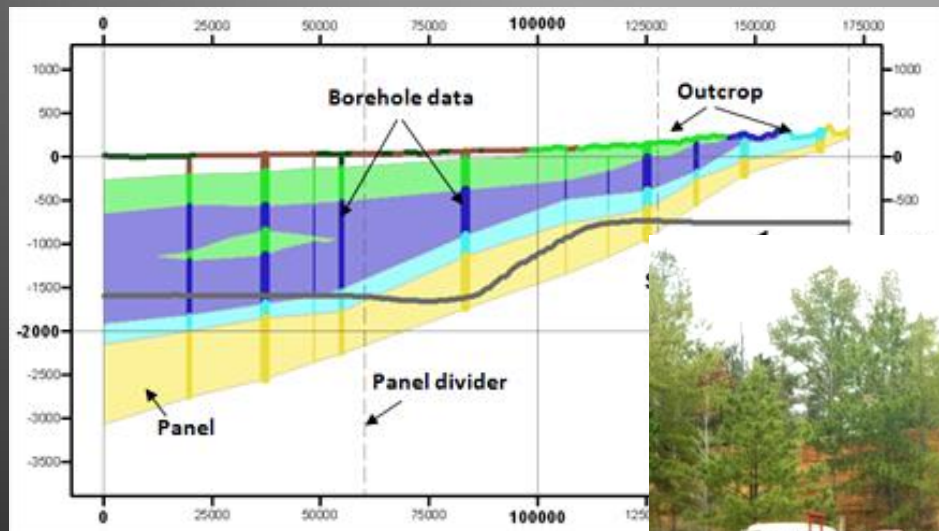

- ▶ Other Equations:

- ▶ Theis – nonequilibrium radial flow equation

- ▶ Thiem – equilibrium flow equation

So what do we know about the subsurface?

- ▶ A lot surprisingly, but mostly inferred
 - ▶ Geotechnical Engineering – boreholes drilled to assess subsurface conditions and soil/rock properties

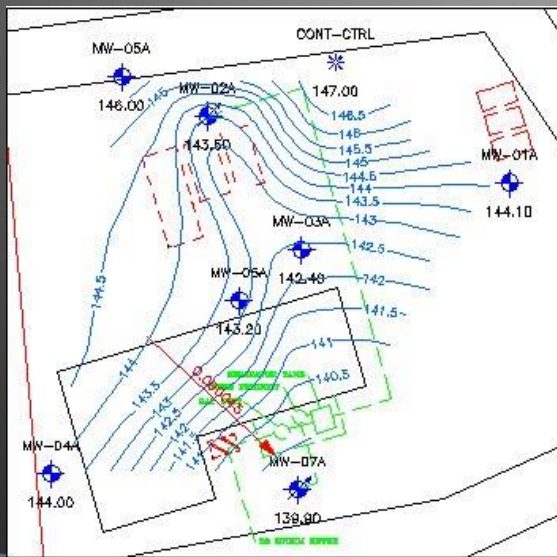

So what do we know about the subsurface?

- ▶ A lot surprisingly, but mostly inferred
 - ▶ Geology – from published or field mapping and from exploration (water, oil, gas, mineral) wells

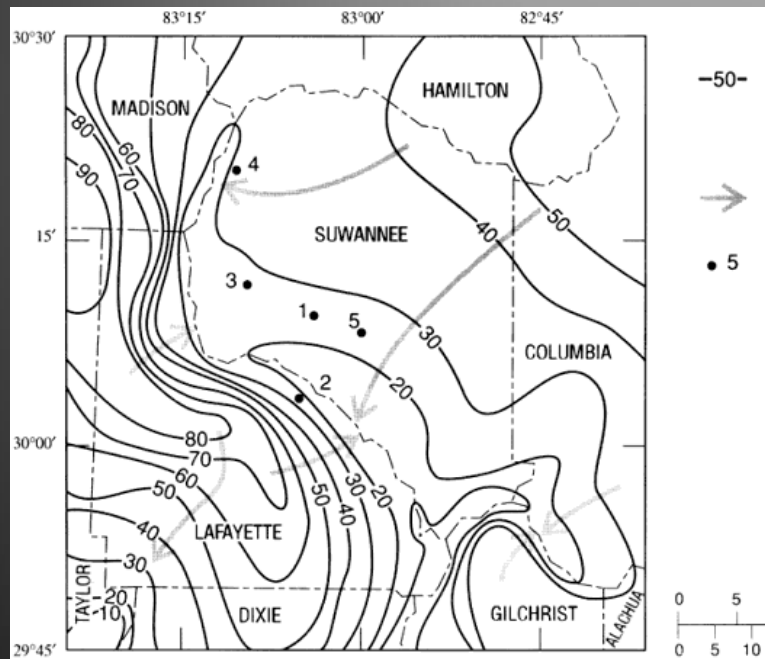

So what do we know about the subsurface?

- ▶ A lot surprisingly, but mostly inferred
 - ▶ Hydrogeology – from published or field testing, local/regional water table observations, pumping tests, tracer tests, water quality analyses, and modeling

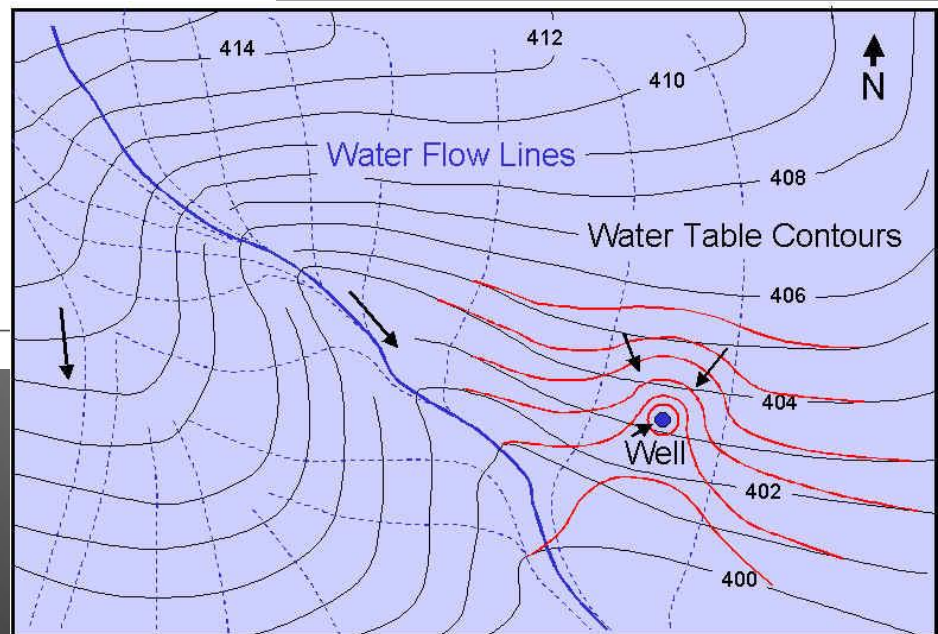

What can available subsurface information tell us?

- ▶ Groundwater flow direction and travel time

- EXPLANATION**
- 50— POTENTIOMETRIC CONTOUR— Shows altitude at which water level stands in tightly cased wells in the Upper Floridan aquifer. Contour interval 10 feet. Datum is sea level
 - GENERAL DIRECTION OF REGIONAL GROUND-WATER FLOW
 - 5 MONITORED BROILER FARM AND SITE NUMBER

What can available subsurface information tell us?

- ▶ Inferred upgradient influence and downgradient impacts

What can available subsurface information tell us?

- ▶ Extent of contaminant plume or well influence area

What can available subsurface information tell us?

- ▶ Water supply well locations

Is the subsurface or inferred
information fool-proof?

How do we use and manage the groundwater resource?

- ▶ Water Supply Wells
 - ▶ Permitting
 - ▶ Design and Construction
 - ▶ Testing

How do we use and manage the groundwater resource?

- ▶ Property or Foundation Protection
 - ▶ Underdrains and Sumps

How do we use and manage the groundwater resource?

- ▶ Construction Dewatering Systems
 - ▶ Well Points

How do we use and manage the groundwater resource?

- ▶ Containment Devices
 - ▶ Slurry Walls

Is there a connection between groundwater and surface water?

- ▶ YES, without question. However, the connection may...
 - ▶ Not be obvious
 - ▶ Be seasonal or episodic
 - ▶ Change over longer periods of time

How is groundwater and surface water connected?

- ▶ Hydraulic Connectivity:
 - ▶ Water moves in relation to elevation differences (i.e., downhill)
 - ▶ Surface water and groundwater want to move deeper, unless hydraulically prevented
 - ▶ Water will follow the path of least resistance
 - ▶ Sometimes the path of least resistance is lateral

How is groundwater and surface water connected?

- ▶ Stream or Ditch Systems:
 - ▶ Gaining
 - Humid regions
 - Wet season
 - ▶ Losing
 - Arid regions
 - Dry season
 - ▶ Disconnected

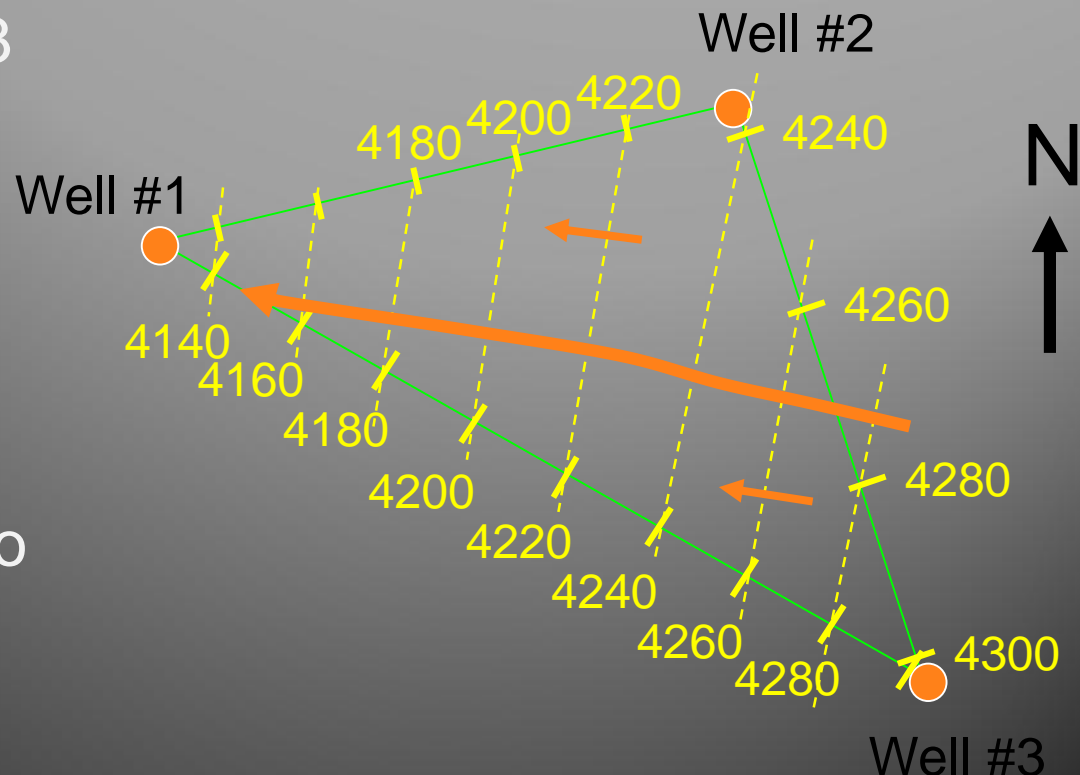

How does this knowledge assist a municipal planning board?

- ▶ There is a basic set of information that can be obtained for all properties relative to understanding the groundwater resource.
- ▶ There are some logical underlying physical principles and properties which govern groundwater movement.
- ▶ There are cause-and-effect relationships (in both directions) between proposed development and groundwater.

How does this knowledge assist a municipal planning board?

- ▶ Basic set of information

- ▶ A minimum of 3 monitoring wells for flow direction and gradient
- ▶ Full year of observations (to see seasonal variability)

How does this knowledge assist a municipal planning board?

- ▶ Logical principles and properties
 - ▶ Upgradient (background)
 - ▶ Downgradient (effects)
 - ▶ Subsurface Materials
 - ▶ Barriers and conduits

How does this knowledge assist a municipal planning board?

- ▶ Provides a basic understanding regarding potential cause-and-effect relationships (two-way) between a proposed development and groundwater
 - ▶ Pervious vs. Impervious Areas
 - ▶ Stormwater Designs
 - ▶ Utility Trenches
 - ▶ Dewatering Systems
 - ▶ Underground Parking Structures

How does this knowledge assist a municipal planning board?

- ▶ Pervious vs. Impervious Areas

www.mmsd.com/wqi/pics/impervious1.jpg water quality initiative

How does this knowledge assist a municipal planning board?

▶ Stormwater Systems

How does this knowledge assist a municipal planning board?

► Utility Trenches

JOINT UTILITY TRENCH

How does this knowledge assist a municipal planning board?

- ▶ Dewatering Systems

How does this knowledge assist a municipal planning board?

▶ Underground Parking Structures

Typical Wellpoint System

WEST ELEVATION
(Olive Street)

The Terrace
*(Direct access from rooms A and B)
Can seat about 130 guests for outdoor dining, 165 reception capacity.*

Pavilion
*20,000 total sq. ft.
(8,000 sq. ft. meeting space)
Will add more than 15,000 sq. ft. of meeting, reception and office space.*

Glass-Walled Pavilion Atrium
Connects the Belo Mansion with the new pavilion, providing dramatic views of the tranquil courtyard with its lush landscaping.

Underground Parking Garage
Will be easily accessible from Olive Street.

How does this knowledge assist a municipal planning board?

- ▶ Potential upgradient and downgradient effects on:
 - ▶ Wetlands
 - ▶ Native Vegetation (trees)
 - ▶ Streams
 - ▶ Ditches
 - ▶ Wells
 - ▶ Water Quality

How does this knowledge assist a municipal planning board?

- ▶ Wetlands and Native Vegetation

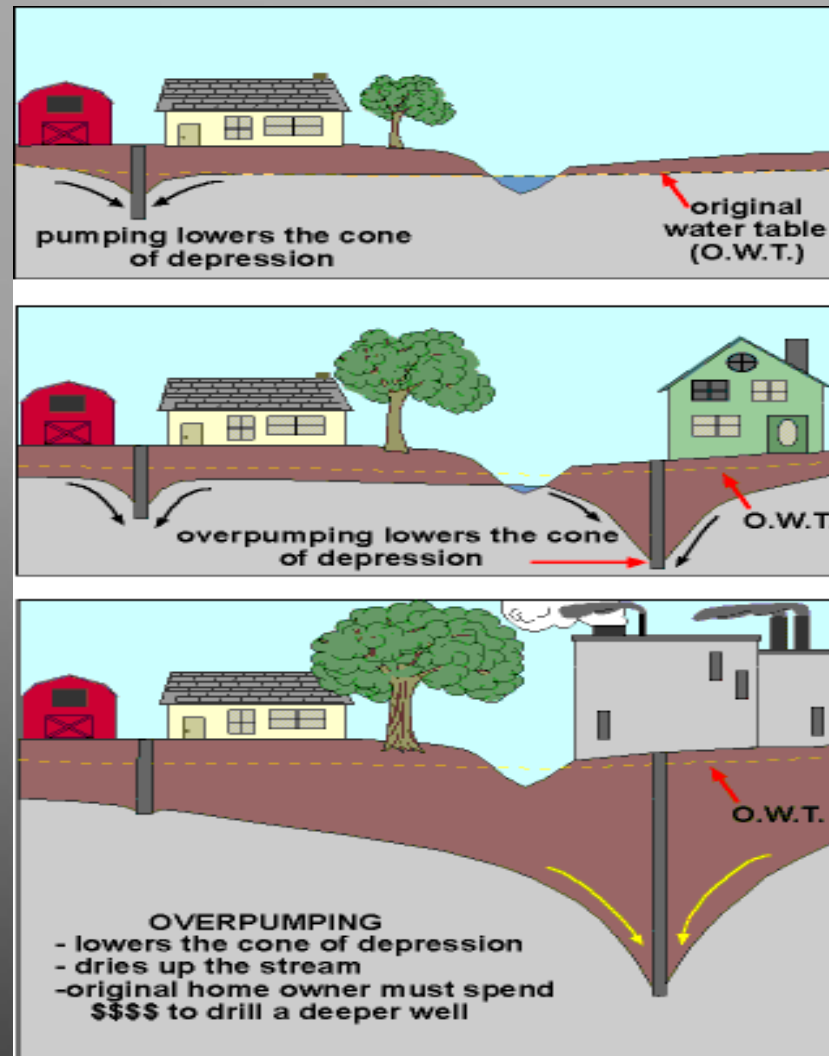

How does this knowledge assist a municipal planning board?

- ▶ Streams and Ditches

How does this knowledge assist a municipal planning board?

▶ Wells

How does this knowledge assist a municipal planning board?

▶ Water Quality

Example of an urban watershed

- | | | |
|---------------------|-----------------|-----------------------------------|
| 1. Downspout | 3. Storm drain | 5. Untreated stormwater discharge |
| 2. Untreated runoff | 4. Sewer system | & Urban stream |
